

Preface

Chapter 1 **Introduction**

- 1.1 Green chemistry and sustainable development
 - 1.1.1 What is ‘green chemistry’?
 - 1.1.2 Quantifying environmental impact: Efficiency, E-factors and atom economy
 - 1.1.3 Just how “green” is this process?
 - 1.1.3.1 Example: The ‘hydrogen economy’ and fuel cell engines
 - 1.1.3.2 Example: The oxidation of propene to propene oxide
 - 1.1.4 Product and process life cycle assessment (LCA)
- 1.2 What is catalysis and why is it important?
 - 1.2.1 Homogeneous catalysis, heterogeneous catalysis, and biocatalysis: Definitions and examples
 - 1.2.2 Connecting catalysis and sustainability: Saving resources by using catalytic cycles
 - 1.2.3 Industrial example: The BHC Ibuprofen process
- 1.3 Tools in catalysis research
 - 1.3.1 Catalysts synthesis and testing tools
 - 1.3.2 Catalyst characterisation tools
 - 1.3.3 Modelling/mechanistic studies tools
- 1.4 Further reading
- 1.5 Exercises
- 1.6 References

Chapter 2 **The basics of catalysis**

- 2.1 Catalysis is a kinetic phenomenon
 - 2.1.1 Reaction rates, reaction orders, rate equations and rate-determining steps
 - 2.1.1.1 The reaction order
 - 2.1.1.2 The rate-determining step
 - 2.1.2 The reaction profile and the reaction coordinate
 - 2.1.3 Zero-order, first-order and second-order kinetics
 - 2.1.3.1 Zero-order rate equations
 - 2.1.3.2 First-order rate equations
 - 2.1.3.3 Second-order rate equations
 - 2.1.3.4 Useful formulas
 - 2.1.4 Langmuir-Hinshelwood kinetics
 - 2.1.5 The steady-state approximation
 - 2.1.6 Michaelis-Menten kinetics
 - 2.1.7 Consecutive and parallel first-order reactions
 - 2.1.8 Pre-equilibrium, ‘catalyst reservoirs’, and catalyst precursors
- 2.2 Practical approaches in kinetic studies
 - 2.2.1 Initial reaction rates and concentration effects
 - 2.2.2 Creating pseudo-order conditions

- 2.2.3 What you see vs. what you get
- 2.2.4 Learning from stoichiometric experiments
- 2.3 An overview of the basic concepts in catalysis
 - 2.3.1 Catalyst-substrate interactions and Sabatier's principle
 - 2.3.2 Catalyst deactivation, sintering, inhibition, and poisoning
 - 2.3.2.1 Catalyst deactivation
 - 2.3.2.2 Catalyst Sintering and thermal degradation
 - 2.3.3 Catalyst inhibition
 - 2.3.3.1 Catalyst poisoning
- 2.4 Exercises
- 2.5 References

Chapter 3 **Homogeneous catalysis**

- 3.1. Metal complex catalysis in the liquid phase
 - 3.1.1 Elementary steps in homogeneous catalysis
 - 3.1.1.1 Ligand exchange: Dissociation and coordination
 - 3.1.1.2 Oxidative addition
 - 3.1.1.3 Reductive elimination
 - 3.1.1.4 Insertion and migration
 - 3.1.1.5 De-insertion and β -elimination
 - 3.1.1.6 Nucleophilic attack on a coordinated substrate
 - 3.1.1.7 Other reaction types
 - 3.1.2 Structure-activity relationships in homogeneous catalysis
 - 3.1.2.1 Steric effects: Ligand size, flexibility, and symmetry
 - 3.1.2.2 Electronic effects of ligands, substrates and solvents
 - 3.1.2.2 Non-innocent ligands
 - 3.1.3 Asymmetric homogeneous catalysis
 - 3.1.4 Industrial examples
 - 3.1.4.1 The Shell higher olefins process (SHOP)
 - 3.1.4.2 The Wacker oxidation process
 - 3.1.4.3 The Du Pont synthesis of adiponitrile
 - 3.1.4.4 The Ciba-Geigy Metolachlor process
- 3.2 Homogeneous catalysis without metals
 - 3.2.1 Classic acid/base catalysis
 - 3.2.2 Organocatalysis
- 3.3 Scaling up homogeneous reactions: Pros and cons
 - 3.3.1 Catalyst recovery and recycling
 - 3.3.2 Immobilised complexes and ship-in-a-bottle catalysts
- 3.4 'Click chemistry' and homogeneous catalysis
- 3.5 Exercises
- 3.6 References

Chapter 4 **Heterogeneous catalysis**

- 4.1 Classic gas/solid systems
 - 4.1.1 The concept of the active site
 - 4.1.2 Model catalyst systems

- 4.1.3 Real catalysts: Promoters, modifiers, and poisons
- 4.1.4 Preparation of solid catalysts: Black magic revealed
 - 4.1.4.1 High-temperature fusion and alloy leaching
 - 4.1.4.2 Slurry precipitation and co-precipitation
 - 4.1.4.3 Impregnation of porous supports
 - 4.1.4.4 Hydrothermal synthesis
 - 4.1.4.5 Drying, calcination, activation, and forming
- 4.1.5 Selecting the right support
- 4.1.6 Catalyst characterisation
 - 4.1.6.1 Traditional surface characterisation methods
 - 4.1.6.2 Temperature-programmed techniques
 - 4.1.6.3 Spectroscopy and microscopy
- 4.1.7 The catalytic converter: An example from everyday life
- 4.1.8 Surface organometallic chemistry
- 4.2 Liquid/solid and liquid/liquid catalytic systems
 - 4.2.1 Aqueous biphasic catalysis
 - 4.2.2 Fluorous biphasic catalysis
 - 4.2.3 Biphasic catalysis using ionic liquids
 - 4.2.4 Phase-transfer catalysis
- 4.3 Advanced process solutions using heterogeneous catalysis
 - 4.3.1 The BP AVADA ethyl acetate process
 - 4.3.2 The CB&I Lummus/Albemarle AlkyClean process
 - 4.3.3 The IFP and Yellowdiesel processes for biodiesel production
 - 4.3.4 The ABB Lummus/UOP SMART process
- 4.4 Exercises
- 4.5 References

Chapter 5 **Biocatalysis**

- 5.1 The basics of enzymatic catalysis
 - 5.1.1 Terms and definitions – the bio dialect
 - 5.1.2 Active sites and substrate binding models
 - 5.1.3 Intramolecular reactions and proximity effects
 - 5.1.4 Common mechanisms in enzymatic catalysis
- 5.2 Applications of enzyme catalysis
 - 5.2.1 Whole-cell systems vs. isolated enzymes
 - 5.2.2 Immobilised enzymes: Bona fide heterogeneous catalysts
 - 5.2.2.1 Binding enzymes to solid supports
 - 5.2.2.2 Trapping enzymes in polymers or sol/gel matrices
 - 5.2.2.3 Cross-linking of enzymes
 - 5.2.3 Replacing ‘conventional routes’ with biocatalysis
 - 5.2.4 Combining ‘bio’ and ‘chemo’ catalysis
- 5.3. Developing new biocatalysts: Better than nature’s best
 - 5.3.1 Prospecting natural diversity
 - 5.3.2 Rational design
 - 5.3.3 Directed evolution
- 5.4 Non-enzymatic biocatalysts

- 5.4.1 Catalytic antibodies (abzymes)
- 5.4.2 Catalytic RNA (ribozymes)
- 5.5 Industrial examples
 - 5.5.1 High-fructose corn syrup: 11 Million tons per year
 - 5.5.2 The Mitsubishi Rayon acrylamide process
 - 5.5.3 The BMS Paclitaxel process
 - 5.5.4 The Tosoh/DSM aspartame process
- 5.6 Exercises
- 5.7 References

Chapter 6 **Computer applications in catalysis research**

- 6.1 Computers as research tools in catalysis
- 6.2 Modelling catalysts and catalytic cycles
 - 6.2.1 A short overview of modelling methods
 - 6.2.2 Simplified model systems vs. real reactions
 - 6.2.3 Modelling large catalyst systems using classical mechanics
 - 6.2.4 In-depth reaction modelling using quantum mechanics
- 6.3 Predictive modelling and rational catalyst design
 - 6.3.1 Catalysts, descriptors, and figures of merit
 - 6.3.2 Three-dimensional (3D) descriptors of homogeneous catalysts
 - 6.3.2.1 Comparative molecular field analysis (CoMFA)
 - 6.3.2.2 The ligand repulsive energy method
 - 6.3.3 Two-dimensional (2D) descriptors of homogeneous catalysts
 - 6.3.4 Descriptors of heterogeneous (solid) catalysts
 - 6.3.4.1 High-level descriptors of solids using QM calculations
 - 6.3.4.2 “Quick & dirty” descriptors for solids using simple parameters
 - 6.3.5 Predictive modelling in biocatalysis
 - 6.3.6 Generating virtual catalyst libraries in space A
 - 6.3.7 Understanding catalyst diversity
 - 6.3.8 Virtual catalyst screening: Connecting spaces A, B, and C
- 6.4 An overview of data mining methods in catalysis
 - 6.4.1 Principal components analysis (PCA)
 - 6.4.2 Partial least-squares (PLS) regression
 - 6.4.3 Artificial neural networks (ANNs)
 - 6.4.4 Classification trees
 - 6.4.5 Model validation: Separating knowledge from garbage
 - 6.4.5.1 Cross-validation and bootstrapping
 - 6.4.5.2 Mixing the dependent variables (y-randomising)
 - 6.4.5.3 Defining the model domain
- 6.5 Exercises
- 6.6 References
